ABSTRACT:

PURPOSE: To centralize mass by placing a carburetor and an air cleaner being arranged up and down on the upper portion of a cylinder head, providing a supercharger on the intake pipe line thereof while providing an intercooler on the lower course side thereof, and placing same on a crankcase.

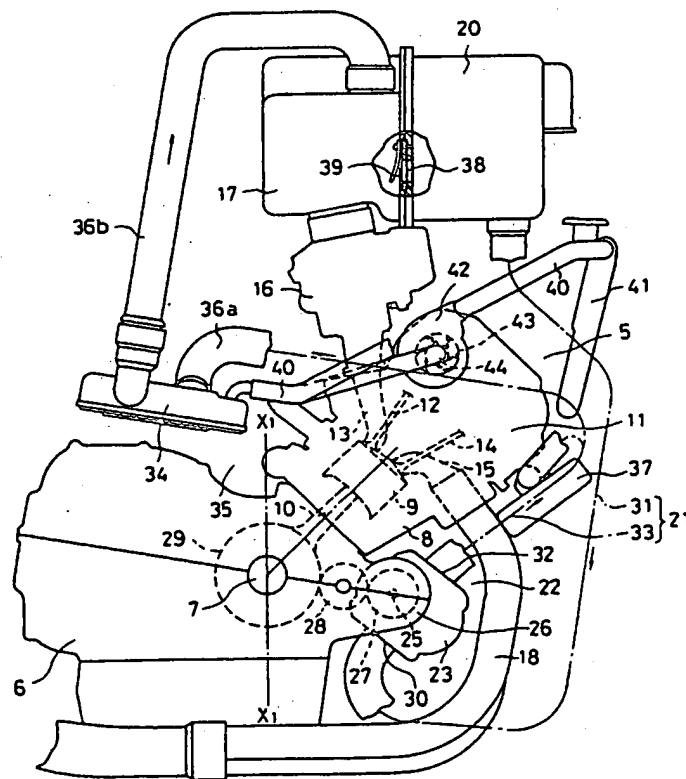

CONSTITUTION: Since a carburetor 16 connected to a cylinder head 11 and an air cleaner 20 are placed on the upper portion of the cylinder head 11, a large space can be ensured above a crankcase 6 adjacent to the backside of the cylinder head 11 and a cylinder block 8, enabling an intercooler 34 to be naturally placed in a space provided above this crankcase 6. Therefore, the water-cooled intercooler 34 having a relatively large weight can be positioned nearly in the vicinity of the center, to enable the position of the center of gravity of a vehicle body to be placed closer to the center, improving drivability and stability.
